Introduction and
background

FSTs in the Apertium pipeline
The Problem: Redundant data
A Solution: Intersection

Implementation of
lt-trim

Preprocessing the bilingual
dictionary
Prefixing the bilingual
dictionary
Moving uninflected lemma
parts
Intersection
lt-trim in use

Ending Dictionary
Redundancy

Conclusion

Acknowledgements

- ▶ Apertium: Free/Open Source, Rule-based Machine Translation platform
- ▶ Goals include:
 - ▶ supporting lesser-resourced languages
 - ▶ wide coverage
 - ▶ post-editable output
 - ▶ reusable resources
- ▶ Language data (dictionaries, etc.) typically organised in language *pairs* (Catalan-Spanish, Portuguese-Spanish, etc.)
 - ▶ historically: each with its own copy of monolingual data

Apertium pipeline architecture

- ▶ Ittoolbox Finite State Transducers used for, among others:
 - ▶ morph. analysis: 'fishes' to fish<n><pl>/fish<vblex><pres>
 - ▶ lex. transfer: fish<n><pl> to fisk<n><m><pl>
 - ▶ morph. generation: fisk<n><m><pl><def> to 'fiskane'

Multiword support

Ittoolbox FST's support a variety of multiwords

An Ittoolbox “lexical unit” is one token, and can be:

- ▶ simple non-multi-words: ‘fish’
- ▶ simple space-separated words: ‘hairy frogfish’ as a single token
- ▶ multiwords with **inner inflection**: ‘takes out’, analysed as `take<vblex><pri><p3><sg># out`, converted to `take# out<vblex><pri><p3><sg>` before lexical transfer

Multiword support

- ▶ **joined** multiwords: ‘they’ll’;

analysed as single token

prpers<prn><subj><p3><mf><pl>+will<vaux><inf>,

then split into two tokens

prpers<prn><subj><p3><mf><pl> and

will<vaux><inf> before lexical transfer

- ▶ **compounds**: ‘frogfish’;

analysed as single token frog<n><sg>+fish<n><pl>,

then split into two tokens frog<n><sg> and fish<n><pl>

before lexical transfer

Multiword support

- ▶ combinations (space-separated + joined + inner inflection):
‘creure-ho que’,
analysed as single token
creure<vblex><inf>+ho<prn><enc><p3><nt># que,
then moved and split into two tokens
creure# que<vblex><inf> and
ho<prn><enc><p3><nt> before lexical transfer

The Problem: Redundant data

Figure: Ideal number of monodixes with four languages

Figure: Current number of monodixes with pairs of four languages

Words in analyser but missing from lexical transfer can be problematic:

- ▶ ‘fishes’ to ‘@fish’: loses the inflection
- ▶ ‘gikk til hundene’ “went to the dogs” to ‘went to @hund’ “went to dog”: losing the inflection hides the idiomatic meaning
- ▶ ‘öldürmedi’ “did not kill” to ‘@öl’ “kill”: loses the *negation*
- ▶ lexical transfer is also tag transfer – structural transfer thus needs exceptions for half-translated tags

But, most importantly, multiword tokenisation means that

‘He takes out the trash’ translates to ‘Han @take out søpla’ *even though both ‘take’-‘ta’ and ‘out’-‘ut’ are in the bilingual dictionary.*

Adding more words makes the translator worse!

A Solution: Intersection

► $\text{FSA1} \cup \text{FSA2} = \text{FSA3}$
